

Immediate-vs-deliberate gap — a veneer-vs-CPT detector, not a depth-among-CPT probe

Gap (delib - imm): A3 +0.091, A1 +0.178, A2 +0.146 (base anchor +0.159).

Gap is NON-MONOTONIC in install depth (A1-light largest, not the deepest arm): $p(\text{gap}, \text{depth-rank}) = 0.50$ (weak).

All three arms are genuine CPT installs, so the low-immediate/high-deliberate veneer signature has little to separate among them → the gap is a VENEER-vs-CPT detector, not a depth-among-CPT probe (needs a matched-t=0 veneer arm).
